

# DAFO<sup>®</sup> R

Regular AFO, PF block, DF block

The DAFO R is designed for strong control of ankle movement where precise control of foot alignment is not required. The tall posterior component effectively blocks plantarflexion and dorsiflexion.

## Key Features

**Custom-fabricated from a cast or scan**

**Fully integrated padding**

**Tall, rigid plastic composition**

**Defined plantar surface contours**

## Designed for patients who:

- Need a fixed ankle position.
- Lack active dorsiflexion, requiring control of foot drop during the swing phase of gait.
- Have good medial / lateral control of foot alignment where correction of excess pronation and supination is not a primary concern.
