

DAFO[®] R

Regular AFO, PF block, DF block

The DAFO R is designed for strong control of ankle movement where precise control of foot alignment is not required. The tall posterior component effectively blocks plantarflexion and dorsiflexion, and is available in two trimlines: Trimline A is more rigid, offering maximum stability. Trimline B is more flexible, with moderate stability and less bulk in the shoe.

Key Features

Custom-fabricated from a cast

Fully integrated padding

Tall, rigid plastic composition

Defined plantar surface contours

Two trimline options

for moderate to maximum PF resist

Designed for patients who:

- Need a fixed ankle position.
- Lack active dorsiflexion, requiring control of foot drop during the swing phase of gait.
- Have good medial / lateral control of foot alignment where correction of excess pronation and supination is not a primary concern.
