Prefabricated moderate support shoe insert

This low-profile foot orthosis is designed to control mild to moderate low tone pronation with an optimal amount of support and comfort, yet minimal volume in the shoe. Partnered with a supportive shoe, the Bug promotes a more comfortable and neutral gait by raising the medial arch and bringing the heel and forefoot to neutral.

Optimizations

including posting and wedging, can be built in for additional foot support or leg-length discrepancy.

Medial arch support

maintains the corrected foot position.

Low-profile trimlines and partial heel cup

contain the foot while adding minimal volume in the shoe.

Flat external surface

works with the shoe to provide a stable base of support.

High density foam

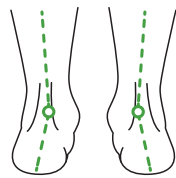

distributes pressure evenly and conforms to unique contours for optimal comfort and alignment.

Easy sizing method

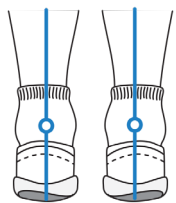

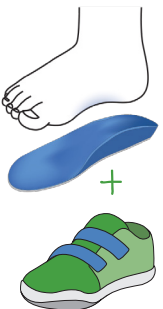

measures the existing shoe insole instead of the foot, for a reliable fit.
Sizes: 4.00 – 13.00 inches
(0.25 inch increments)

Flattened, flexible toe shelf

promotes natural toe-off and can be trimmed to fine-tune the fit.

Moderate pronation, unstable foot position.

Improved foot alignment and steadier gait.

Designed for patients who:

- Exhibit mild to moderate pronation and have a fully-correctable foot position.
- Present with a reduced yet visible medial arch, mild to moderate heel eversion, and forefoot abduction.
- May benefit from the sensory feedback that a contoured shoe insert can provide.
